

5G Implementation in Defect Inspection Facility

5G Network Foundation Course Finals

Inspection Facility

- Focus in Automotive parts
- Have 5 Inspection Line

Scenario Information: What we working on?

Parts to be Inspect

Piston

Gearbox Housing

Suspension Rods

Body Panel

Wheel Rim

Inspection Requirements

Detection Surface				
6 (4 in High Res)	6 (2 in High Res)	8 (3 in High Res)	4 (1 in High Res)	6 in Normal Res
Minimum Defect Size				
1 mm/pixel	1 mm/pixel	1 mm/pixel	1 mm/pixel	3 mm/pixel
Detection Details				
<ul style="list-style-type: none">• High resolution indicates 1920x1080 / Normal resolution is 800x600 (pixel).• Camera record in 30 Frame per Second (fps) is capable to detect defects accurately.• All the recordings and detection results have to sent to central database for QC reports.				

Project Objectives: Trade-offs

- **Design and validate URLLC network slices** to meet sub-10 ms latency for high-precision streams.
- **Integrate Multi-Access Edge Computing (MEC)** nodes at the factory floor to offload inference and minimize core-network latency
- **Benchmark open-source 5G stacks** under mixed URLLC/eMBB traffic replicating our five inspection lines.

Defect-Detection Performance Requirements

Default 0.32

$$\text{Bitrate (bps)} = \text{Width (px)} \times \text{Height (px)} \times \text{Frame rate (fps)} \times \text{BPP}$$

Critical inspection faces (1920x1080)

- End-to-end latency ≤ 10 ms
- Packet-loss rate $\leq 10^{-5}$

$$1920 \times 1080 \times 30 \times 0.32 \approx 19,907,712 \text{ bps} \approx 19.9 \text{ Mbps}$$

Non-Critical inspection faces (800x600)

- Support $\geq N$ simultaneous streams
- Average one-way latency ≤ 50 ms

$$800 \times 600 \times 30 \times 0.32 \approx 4,608,000 \text{ bps} \approx 4.6 \text{ Mbps}$$

Mapping to 5G QoS

URLLC slice

- Latency Budget: ≤ 10 ms
- Reliability $\geq 99.999\%$ (packet-loss $\leq 10^{-5}$)
- Guaranteed Bitrate

eMBB slice

- Throughput 5 Mbps per 600p stream
- Latency Target: ≤ 50 ms
- lower than URLLC but above standard best-effort

Quality of Service (QoS) in the Scenario

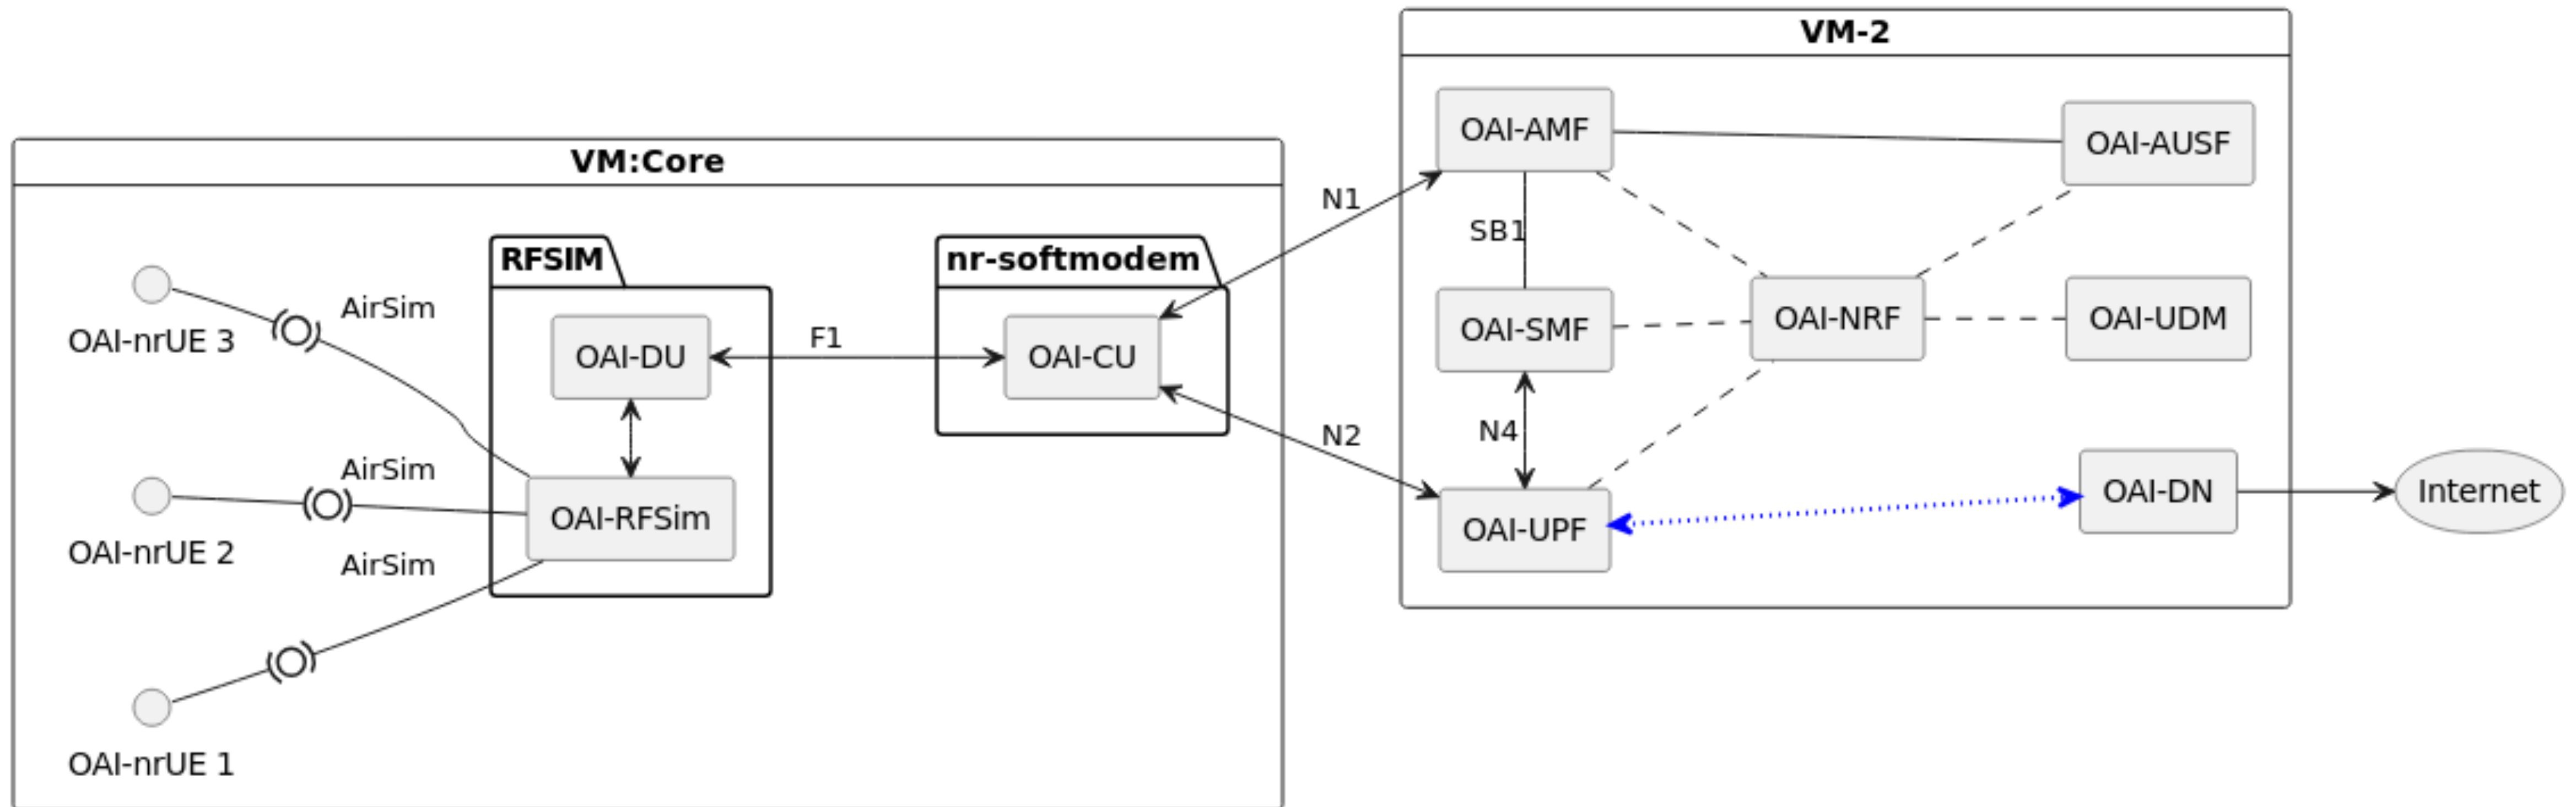

- key performance that the network must satisfy, including *Latency*, *Reliability*, and *Throughput* (bitrate).
- In the Defect Inspection scenario, different camera streams have vastly different requirements for image quality and latency:
 - **High Resolution** : Used for Critical Inspection → Requires low latency and high reliability, otherwise it will affect real-time alerts and decision-making.
 - **Normal Resolution** : Used for **Non-Critical Inspection** → Can tolerate higher latency and may use a more relaxed eMBB channel.

Slice Type	Use Case	Resolution / Bitrate	Latency	Reliability
URLLC	Critical Inspection	1920x1080 @ 30fps (19.9 Mbps)	$\leq 10\text{ ms}$	$\geq 99.999\%$ (Packet-Loss $\leq 10^{-5}$)
eMBB	Non-Critical Inspection	800*600 @30fps (4.6 Mbps)	$\leq 50\text{ ms}$	Best-Effort

Overall System Architecture

- This diagram illustrates the complete architecture of our 5G network system, showing the interconnections between different network components and layers.

Setup End-to-End

Network Configuration Setup

- Detailed view of the network configuration parameters and settings required for establishing the 5G network connections.

Analysis

- **Test Configuration**
 - Tool: iperf3 version 12.1.1.1
 - Buffer Size: Camera I: 19.9M, Camera II: 23M
 - Test Duration: 10 seconds each
 - Parallel Streams: Camera I: 20, Camera II: 10
 - Port: Camera I: 5201, Camera II: 5202
- **Analysis Summary**
 - Camera I (Normal Resolution):
 - Lower individual stream throughput but higher parallelism
 - 20 concurrent streams at ~4.87 Mbits/sec each
 - Total aggregate throughput: 97.3 Mbits/sec
 - Camera II (High Resolution):
 - Higher individual stream throughput with moderate parallelism
 - 10 concurrent streams at ~23.0 Mbits/sec each
 - Total aggregate throughput: 230 Mbits/sec (2.4x faster overall)
 - The high-resolution camera achieves significantly better overall performance despite using fewer parallel connections, indicating more efficient per-stream utilization.

Metric	Camera I (Normal-Res)	Camera II (High-Res)
Individual Stream Performance		
Data per Stream	594 KBytes	2.74 MBytes
Bitrate per Stream	4.87 Mbits/sec	23.0 Mbits/sec
Test Duration	8.00-9.00 sec	7.00-8.00 sec
Aggregate Performance		
Total Data Transferred	11.6 MBytes	27.4 MBytes
Total Bitrate	97.3 Mbits/sec	230 Mbits/sec
Number of Streams	20	10
Efficiency Metrics		
Data per Stream Ratio	1x	4.6x
Bitrate per Stream Ratio	1x	4.7x
Total Throughput Ratio	1x	2.4x
